THE AFTER-DARK PHOTO FIELD GUIDE

If you're in it, find it.

Your best moments are scattered across your friends' phones.
Bring your own photos home, with their approval.

SELECT · VERIFY · FIND · APPROVE · KEEP

An illustrated walkthrough + a hands-on two-phone test run.
Made for pandal hopping, trips, parties, and the morning after.

14 OCT 2026 / ANDROID 0.2.0 (DEBUG)

One night.
Four places to go.

Start small: two phones, one event, and six photos you can share.

01 Events

Create a night or scan a friend's invitation. Select the same event on both phones.

02 Photos

Add selected photos, review Of me, and keep track of Requested originals.

03 Friends

Start nearby sharing. Compare the code before accepting. Manage future access here.

04 You

Choose a nickname, add optional selfies, manage privacy, and leave local feedback.

BEFORE YOU HEAD OUT

- [ ] Open and install the supplied APK on both Android 10+ phones.
- [ ] Use phones with compatible Google Play services.
- [ ] Keep Bluetooth and Wi-Fi on, and both apps open.
- [ ] Prepare authorized photos: you, friends, a group, and no face.

Choose first. Connect second.

Opening Android's photo picker or leaving the app stops sharing. Select your photos and selfies first, then reconnect and verify.

One invitation.
Two verified phones.

Matching event names are not enough. Join using the same QR invitation.

1

PHONE A: CREATE

In Events, tap Create event and enter a name. Open Show invitation and let your friend scan its QR.

2

PHONE B: JOIN

In Events, open Join event, then Scan invitation QR. Other ways to join offers a saved QR image or pasted invitation.

3

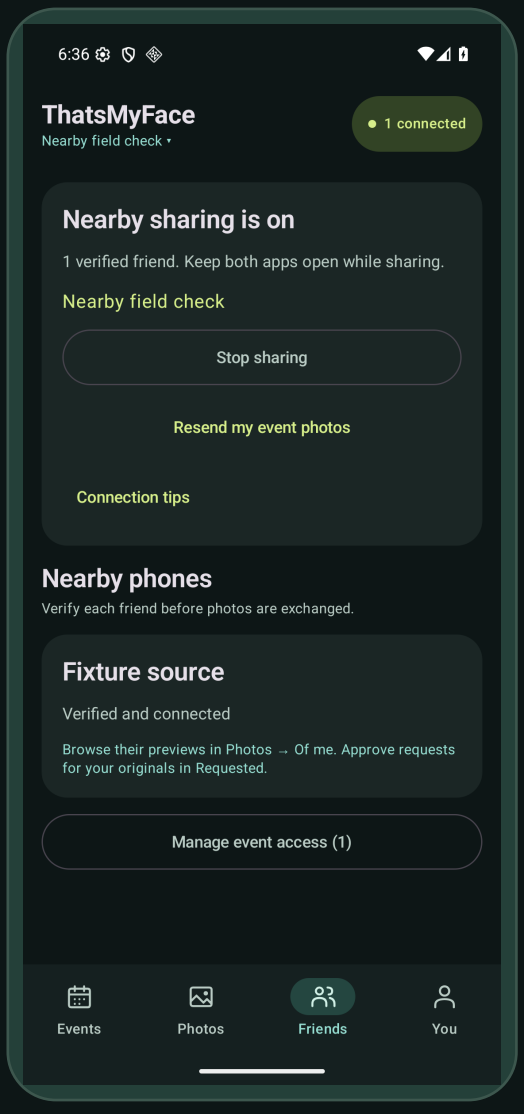

BOTH: START

Open Friends and Start nearby sharing. Allow the nearby permissions when asked. Tap Connect beside your friend.

4

COMPARE IN PERSON

Read the short code on both phones. Tap The codes match on both only when they match. Otherwise reject.

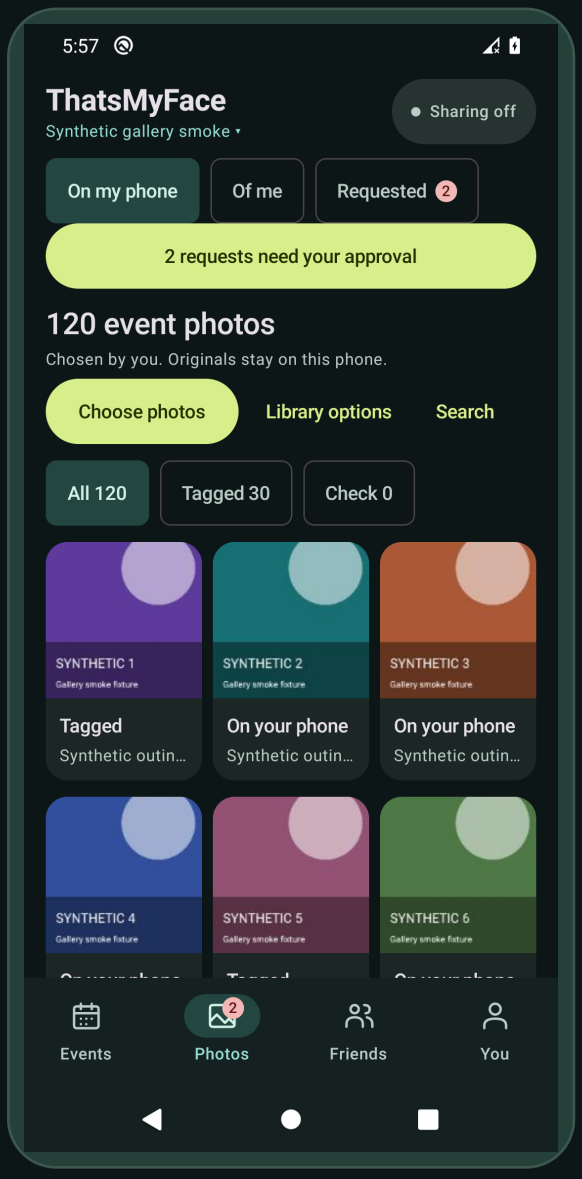

Actual Nearby SDK pairing on two API 36 emulators. This verifies virtual-device behavior, not physical radio interoperability.

AFTER PAIRING: VERIFIED AND CONNECTED

Pair directly with each phone whose photos you want. Friends do not relay another phone's originals. A saved event-access entry is permission, not a live connection.

A hundred photos.
A little less scrolling.

Select only the photos you want this event's verified friends to see.

Actual app UI with synthetic test records. Seeded tags and requests illustrate UX, not recognition or transfer results.

PHOTOS > ON MY PHONE

Add intentionally

Use Choose photos for explicit selection. Library options also lets you authorize an event folder and its subfolders, then rescan it manually.

Browse the grid

Tap Search or use All, Tagged, and Check filters. Open a thumbnail to inspect it or use Tag or correct people. Close details to return to your place.

Pick your view

On my phone is your selection. Of me has For you, Uncertain, Confirmed, and All previews. Search by filename or friend. Requested holds your downloads.

Previews are shared. Originals are approved.

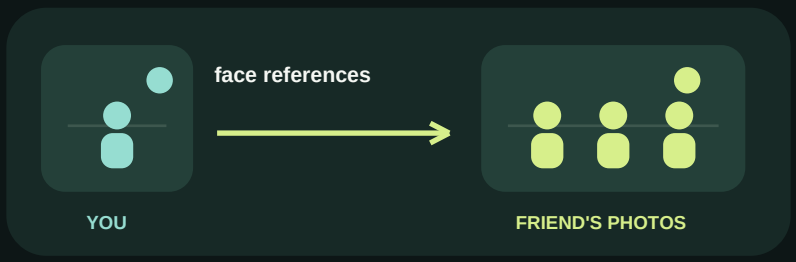

Selection allows verified event friends to see small previews, including photos without a match. Each original needs owner approval and may include camera location metadata.

A suggestion.
You make the call.

Real face matching runs on the phone holding the selected photos.

YOU > CHOOSE REFERENCE SELFIES

Choose 1 to 5 clear selfies with only you in each. Then enable face-reference sharing for this event if you want friends' phones to look for you.

References are sensitive; selfie images are not sent. To scan your own selected photos after enrollment, tap Find me in my photos in Of me.

Suggested

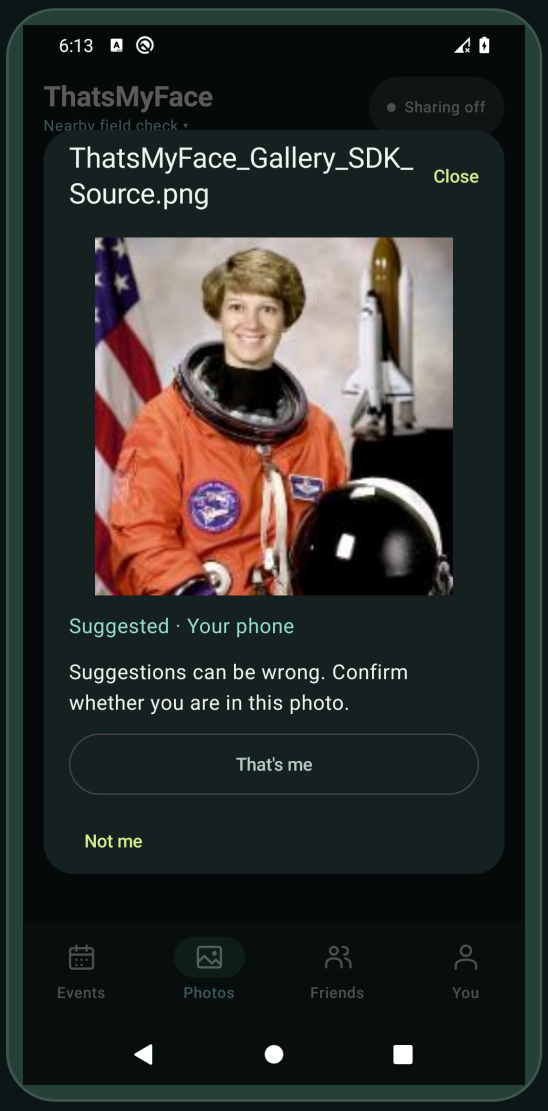

Looks similar. Inspect the photo.

Please check

Uncertain. Low light or blur can confuse it.

No face match

Browse all previews to catch missed photos.

Actual on-device match using the public-domain NASA test portrait. This verifies execution, not real-world accuracy.
NASA: Eileen Collins, via scikit-image. No endorsement implied.

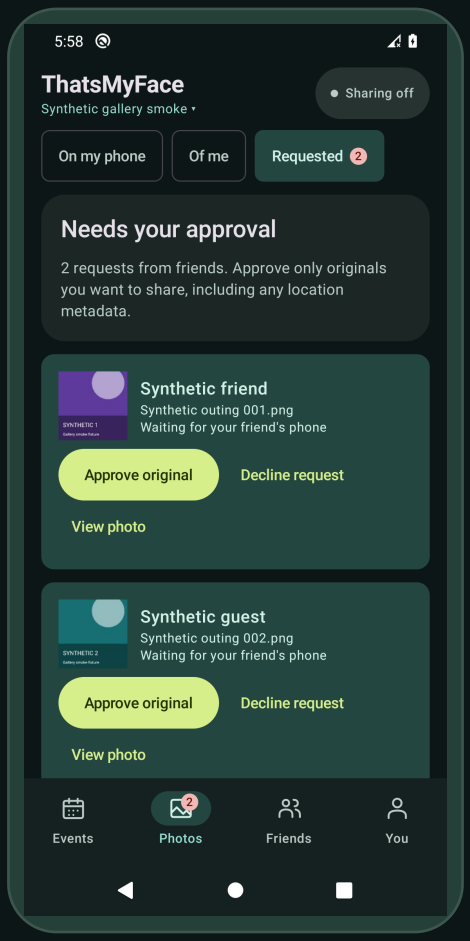

That's me / Not me

Confirm correct suggestions and reject wrong ones. Open All previews to review misses and manually mark your photos. A match never grants access or approves a download.

Ask. Approve. Keep.

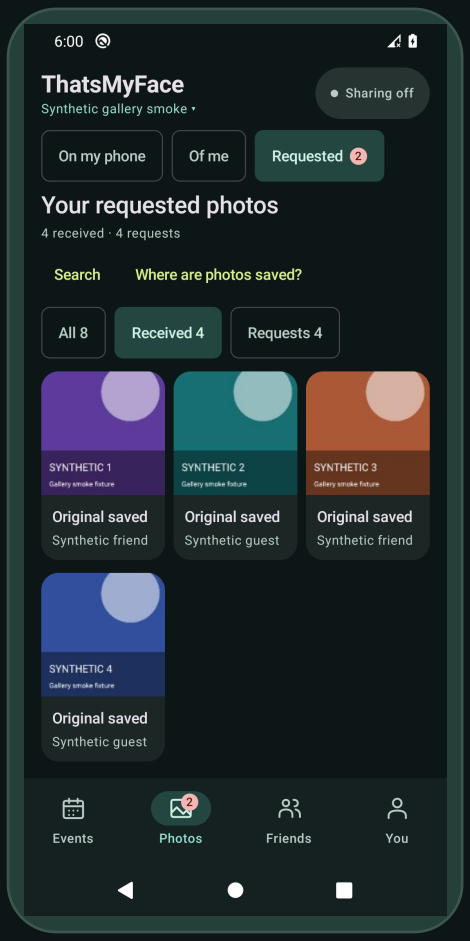

An original moves only after its owner says yes. Both phones need to stay connected.

OWNER'S PHONE

Actual app UI. Seeded test requests show the owner's approval controls.

YOUR PHONE

Actual app UI with synthetic test records. This illustrates the collection, not a radio transfer.

1

Request original

Open a friend's photo in Of me. The request details open next.

2

Approve original

Owner opens the Photos approval alert or Requested.

3

Open saved photo

After completion, open it from Requested.

GALLERY DESTINATION Pictures/ThatsMyFace/Requested

Two phones.
One complete round trip.

Phone A owns the test photos. Phone B is in some of them. Then swap roles.

01 Set up the same event

Use different nicknames. A creates the event; B scans A's invitation.

Both show the same event. Relaunching preserves local setup.

02 Select + enroll

A selects six authorized photos. B adds clear selfies and opts in for the event.

Only selected photos belong to the event. Unrelated gallery images are absent.

03 Verify + browse

Start sharing, compare the digits, and accept on both phones.

One live friend entry. B sees A's previews. Try the All previews filter.

04 Review the matches

Check correct, wrong, uncertain, group, and no-face photos. Confirm or reject.

Decisions stick after relaunch. Record mistakes and misses. A suggestion can be wrong.

05 Ask, then approve

B requests one original. Before A approves, inspect both phones. A approves.

No original arrives before approval. After approval, progress reaches a saved copy.

06 Find it + repeat

B opens Requested and the gallery Requested album. Check the saved copy.

The original opens. Retrying does not add a second saved copy. A's source remains.

Want a stronger integrity check? Compare original file size and SHA-256 on consenting test devices. A visual match alone does not prove identical bytes.

Break the connection. Keep the trust.

Use expendable test copies for permission and deletion checks. Leave source originals untouched.

Reject a pairing

Reject the verification on one phone. Also try a separate event with the same name.

EXPECT No private previews or originals before both peers verify in the same invited event.

Decline an original

Request a photo, then choose Decline request on the owner phone.

EXPECT The request is declined. No original is saved on the receiver.

Disconnect + retry

Lock the source mid-transfer. Reconnect and verify. Test retry from the receiver, then from the owner.

EXPECT Waiting or failure is honest. Retry finishes only when the owner returns and permits it.

Try the same request twice

Repeat the request or relaunch after a transfer. Use Check saved copy.

EXPECT One intact received file remains. A missing received copy needs fresh approval to replace.

Remove selected access

Revoke access to a disposable selected test file, or move that test copy. Refresh the event.

EXPECT The file cannot be sent. Reselect it to restore access; unrelated photos stay untouched.

Go without internet

After setup, turn mobile data off and disconnect internet Wi-Fi. Keep Wi-Fi and Bluetooth enabled.

EXPECT Test discovery, matching, and an approved original. Record the result for both phones.

Also try: 100+ photos, large text, TalkBack, landscape, denied permissions, and low storage. Offline capability does not mean the phone or SDK never makes network requests.

Your photos.
Your call.

No account or app cloud photo library. You choose what gets shared and what stays local.

STOP THIS SESSION

Tap Stop sharing in Friends. Locking the phone or leaving the app also stops it.

STOP FUTURE ACCESS

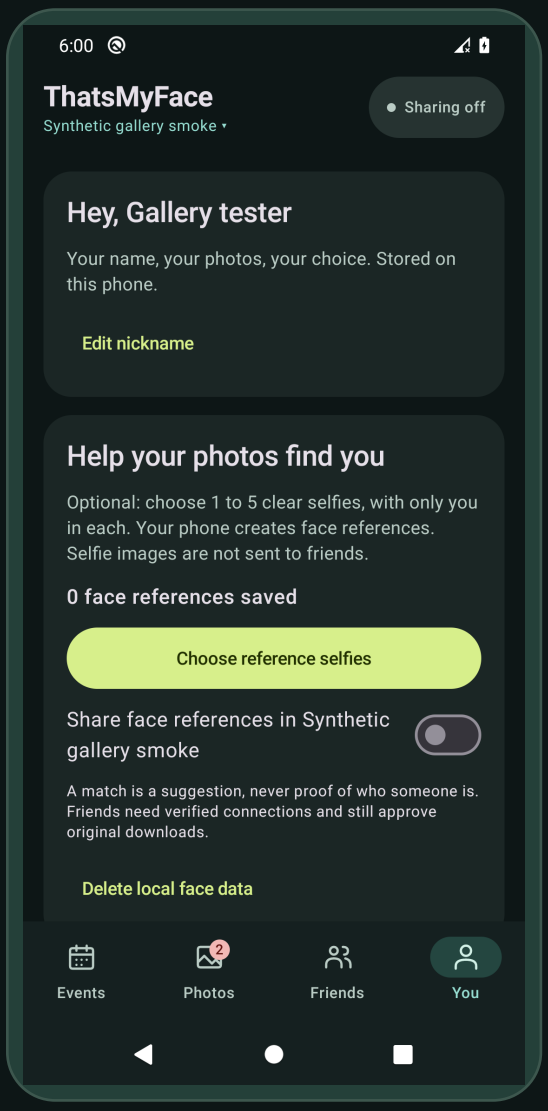

Open Manage event access in Friends, then Remove future access. Downloaded copies cannot be recalled.

REMOVE FACE DATA

In You, switch off event reference sharing or choose Delete local face data. Previously shared data on offline phones cannot be recalled.

RESET THE APP

Delete local app data removes profile, events, references, requests, and feedback. Source photos and received gallery copies remain.

Actual You screen with a local test profile. No private face data is shown.

Tell us how the night went

In You, tap Leave feedback, write a short note, and Save feedback. Export saved notes only when you choose. Include the problem and what you expected; leave out private photos, faces, names, and invitation codes.

What worked?
What needs another try?

Save this PDF after checking its boxes. Short observations are more useful than private screenshots.

PHONE A / ANDROID

PHONE B / ANDROID

APK VERSION / TEST DATE

MATCHES: RIGHT / WRONG / MISSED / UNCERTAIN

RESULT / WHAT YOU EXPECTED / WHAT HAPPENED

WHAT THE EVIDENCE SAYS

Automated. Build/lint, 88 JVM tests, real-model checks, and CI on API 29/36 passed. All 58 Android tests also passed on the physical Nothing A142.

Devices. Production Nearby SDK on two API 36 emulators passed pairing, recognition, rejection, restart/retry, and an approved original with exact bytes and one saved copy.

Still pending. Two-phone acceptance is blocked by the second phone's USB-install restriction. Physical offline/recovery, TalkBack, and field accuracy remain open.

IF SOMETHING GETS STUCK

No friend / no photos	Same QR event? Sharing on both? Codes accepted? Try the All previews filter.
Awaiting owner approval	The owner must tap Approve original in Photos > Requested.
Waiting for your friend	Bring both apps back, reconnect, verify, then retry the request.
Access removed / missing	Reselect the authorized source. A received copy is separate from its source.

VERSION 0.2.0 (debug) / BUILD 19775d4
